Loxone's product reveal: Audioserver developed for AV gurus, electrical experts and more
Loxone releases a flexible, complete audio solution for any home or building.
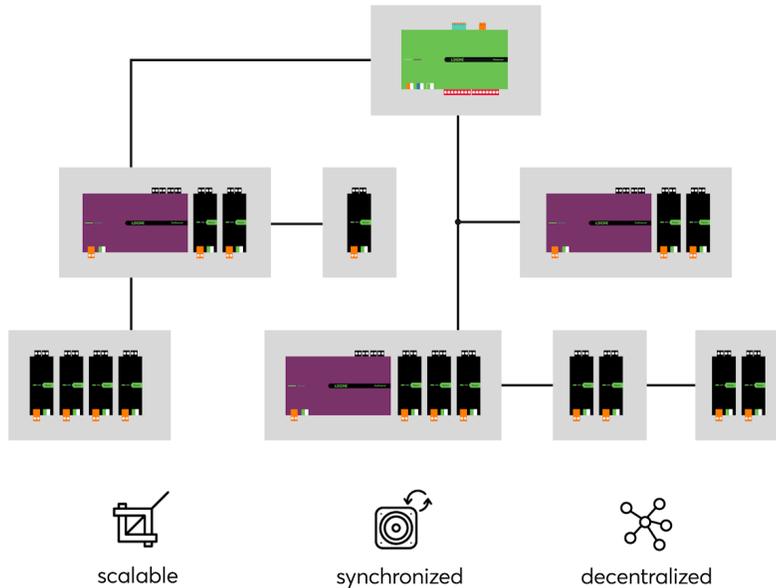

September 3, 2020 – Starting a new wave of home & building automation since Loxone's Miniserver 10+ years ago, the new Audioserver delivers a unique multiroom audio experience. The ultimate flexibility, simple configuration and time-saving installation makes it a sensible solution for not only AV professionals, but also electrical experts that want to expand their expertise. Offering numerous interfaces, functions and free scalability, the Audioserver offers a seamless solution paired with any speakers on the market.

Its flexibility and built-in smart features takes audio solutions to another level especially for MDUs, hotels and more. Use it as an alarm system in a restaurant, intelligent doorbell at home, or for announcements in the office and much more. Plus, energy is saved as it consumes only 2W in idle mode.

Specially developed for professional installers, the Audioserver combines a high processing power and four amplifier outputs in one compact device – designed to be DIN rail mounted. They can offer customers with a myriad of combinations of stereo and downmixed audio. Audio is automated to their liking – format, time, volume, room and more – with instant control always an option in the Loxone App or with the tap of a Touch switch.

With simplified configuration tools in Loxone Config, time-consuming systems are a thing of the past. In our latest software version 11.1, you simply drag and drop "Audio Player" functions to configure groups. So residents, visitors or users of any building can enjoy the power of four compatible audio zones with 100% synchronous sound experience in multiple rooms – all created by a single audio source. In larger audio networks, several Audioservers can be grouped and synchronized. Tree Turbo interface by Loxone enables the expansion of up to 10 Stereo Extensions (or 20 amplifier outputs). You can simply wire from the distribution board to a Stereo Extension installed locally to where the speaker is thanks to free-form wiring topology.
