

Loxone Intercom changes what you know about intercom systems

Designed to be simple with advanced functionality, the Intercom is a reliable, flexible access control solution for homeowners and installers.

May 5, 2021 – With the development of the new Intercom, it's not about what's added, but what's taken away. [The Intercom](#) is designed meticulously down to the basics with the finest materials and state-of-the-art technology. You get more out of numerous features with a HD camera, hidden speaker, protected microphone and built-in proximity sensor that lights up an interactive bell button.

As always, there is no cloud dependence or risk of unprotected data – critical areas where other intercom systems fall back. Communication between the Intercom and the Loxone App takes place with true end-to-end encryption, ensuring the highest security standards are met for homeowners.

Plus, the Loxone Intercom is easily installed in just a few minutes without needing a backbox, including remote access via Remote Connect. With practical push-in terminals, a power supply via PoE and many other features, the Intercom meets the needs of electricians and integrators.

Simplifying access control even further, the Intercom creates the most flexible, comprehensive [access control solution](#) when paired with the newest NFC Code Touch and all-new Mounting Brackets. The Intercom's integrated Tree interface means that up to 50 additional Loxone Tree devices (max 3W) can be added. In the Loxone App, remote access makes it easy to access functions and interact with visitors at any time and place, including text-to-speech functionality.
